

### Problemset 5.

1. A subset  $A$  is a  $G_\delta$  subset if  $A = \bigcap_{i=1}^{\infty} G_i$  is a countable intersection of open sets  $\{G_i\}$ . Show that every closed set is a  $G_\delta$  set. If  $A$  is a  $G_\delta$  subset of a complete metric space  $(X, d)$  show that there is metric  $D$  on  $A$  that induces the same convergence as  $d$  on  $A$ , but  $(A, D)$  is complete.
2. Given  $k$  pairwise disjoint closed sets  $C_1, \dots, C_k$  of  $X$ , show that there is a continuous function  $f(x)$  on  $X$  with  $f(x) = i$  on  $C_i$ .
3. If  $C$  is a closed subset of  $X$  and if  $0 \leq f \leq 1$  is a continuous function on  $C$  can it always be extended as a continuous function on  $X$  satisfying  $0 \leq f \leq 1$  on  $X$ ?
