Coin-weightings and different directions of lines

Zoltan Furedi

Renyi Institute, Budapest and UIUC, Urbana-Champaign, IL, USA

Starting with a version of coin-weighting problems proposed by ApSimon (1984) we discuss directions of lines among lattice points. Consider a set V of k vectors on the plane with non-negative integer coordinates. Let $S(V)$ be the set of the $2^k - 1$ non-empty subset sums. We are looking for the smallest $N = N(k)$ such that V is a subset of $\{1, 2, 3, \dots, N\} \times \{1, 2, \dots, N\}$ and the slopes of the members of S are all distinct.
