MATHEMATICAL ASPECTS OF HEART PHYSIOLOGY

CONTENTS

I.	Introduction	1
II.	Cardiac Fluid Dynamics	11
	1. Results from Vector Analysis	11
	2. Dynamics of Heart Valve Closure	26
	3. Diffusion of Momentum (Viscosity)	40
	4. Vorticity	50
	5. Pressure and Flow Across Heart Valves	61
	6. Numerical Analysis of Blood Flow in the Heart: Formulation of the Problem and Introduction to the Numerical Methods	81
	7. Numerical Analysis of Blood Flow in the Heart: Boundary Representation and Numerical Stability.	96
	8. Heart Sounds and Murmurs	115
III.	The Differential Geometry of the Heart	127
	1. Results from Differential Geometry	127
	2. Differential Geometry of Heart Valves	134
	3. Fiber Architecture of the Heart Wall	138
IV.	Heart-Lung Interaction	148
	1. Ventilation/Perfusion Ratio	148
	2. Mechanical Influences on the Distribution of Ventilation and Perfusion	152
	3. Shear Stress and Pulmonary Vascular Diameter	154
	4. Regulation of Blood Flow to Individual Alveolar Units	157

V.	Muscle Mechanics	158
	1. The Steady-State Properties of Muscle	158
	2. The Anatomy of Contraction	167
	3. Cross-Bridge Dynamics	169
	4. Solution of the Cross-Bridge Population Equation	172
	5. Heart Muscle	186
	6. Active State in the Context on A. V. Hill's Model	191
	7. Active State in the Context of Cross-Bridge Dynamics	195
	8. Intracellular Calcium Kinetics in Heart Muscle .	199
VI.	Control of the Heart	212
	1. General Principles	212
	2. Experiments and Models	224
	3. Long-Term Regulation of Arterial Pressure . . .	234
VII.	Principles of Electrophysiology with Special Reference to the Heart	241
	1. Electrical Fundamentals	241
	2. Work of Concentration	244
	3. Ionic Fluxes	245
	4. Drift-Diffusion in a Constant Field	247
	5. Hodgkin-Huxley Equations	250
	6. Non-Linear Wave Propagation	260
	7. Self Synchronization of the Cardiac Pacemaker .	268
